# Ethernet analog input system 16 analog inputs, diff., 16-bit

on request

DatabaseConnect see page 114

www.addi-data.com

# Features

- 24 V digital trigger input
- ARM<sup>®</sup>9 32-bit processor
- 64 MB onboard SDRAM for storing data
- Robust standardized metal housing
- Power Save Mode: Reduced power consumption when
  no acquisition runs

#### Analog inputs

- 16 diff. inputs, 16-bit, 5-pin M12 female connector
- Sampling frequency max. 100 kHz, up to 4 simultaneous channels
- Input ranges: ±5 V, ±10 V (16-bit), 0-5 V, 0-10 V (15-bit)
- Gain PGA x1, x2, x10, x20, x100, x200, x1000, x2000 software-programmable, signals up to +/-5mV (16-bit) are possible
- Current inputs optional

#### Safety features

- Status LEDs for fast error diagnostics
- Optical isolation Input filters
- Overvoltage protection ± 40 V
- Internal temperature monitoring

### Interfaces

- Fast 24 V trigger input
- Ethernet switch with 2 ports
- Synchronisation/trigger In/Out
- Line in for 24 V supply and cascading

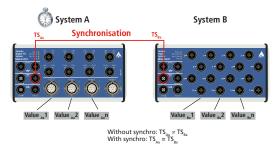

#### **Communication interfaces**

- Web server (configuration and monitoring)
- Command server SOAP for transferring commands
- Data server (TCP/IP or UDP socket) for sending
- acquisition data
- Event server (TCP/IP socket) for sending system events (Diagnostics such as temperature, short-circuits ...)
- Command server Modbus TCP and Modbus (UDP) for sending commands

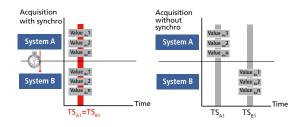

## Synchronisation/time stamp

#### Time stamp

Several MSX-E systems can be synchronised with one another in the µs range through a synchro connection. This allows to start a synchronous data acquisition, to generate trigger events and to synchronise the time on several MSX-E systems. Furthermore, the systems have a time stamp that logs the point in time at which the data was acquired by the system.

The combination of synchronisation and time stamp (TS) allows the clear allocation of signals that were captured by several systems.

# Acquisition modes

#### Auto-refresh mode

In auto-refresh mode, the measurement values are updated automatically after each acquisition. The acquisition is initialised once and the values of the channels are stored in the memory of the MSX-E Ethernet system. The client (e.g. PC, server, PLC, ...) reads the acquired values asynchronously to the acquisition through socket connection, SOAP or Modbus function. Thereby, the new value is read and the old values are overwritten. In addition to the measurement values, the auto-refresh counter can also be read, which allows to sort the measurement values chronologically. The auto-refresh mode can be combined with a hardware or a synchro trigger and also allows the automatic averaging of values.

#### Sequence mode

In sequence mode, a list of channels is acquired. Thereby, the single measurement rows are stored one after another. The client receives the acquired values asynchronously to the acquisition through a socket connection. In the sequence mode, the measurement values are read in chronological order, this means the oldest values are read first. The acquisition can be effected continuously, with or without delay or in combination with a hardware or synchro trigger.

# Horizontal wiring (with 4 gauges/sensors)

# Vertical wiring (with 4 gauges/sensors)

#### Acquisition triggered through trigger or synchro input

**Example:** A measurement process is to be started through an external trigger impulse. For each trigger, 10 sequences are to be acquired. After the acquisition of the 10 sequences they are to be sent to the client.

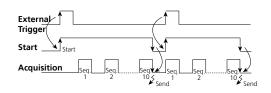

#### Reading data from a MSX-E system

MSX-E systems are multi-client capable, this means several clients (e. g. PC, server, PLC, ...) can read the measurement values of one MSX-E system at the same time. For this, each client establishes a socket connection to the data server of the MSX-E system (port 8989). As soon as the measurement values are available on the data server, the MSX-E system transfers them to the clients.

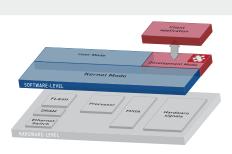

# Onboard programming / stand-alone operation

#### **Development mode**

With the Development mode of the MSX-E systems you can customise your measurement, control and regulation applications to fit your requirements. The programs run directly on the MSX-E systems, which has two advantages: external PCs are relieved and you can process data freely according to your requirements. This helps you to improve the efficiency of your processes and to secure your investments.

# ConfigTools

The ConfigTools program allows an easy administration of the MSX-E systems. These are automatically detected in the network. ConfigTools consists of common and specific functions.

In addition, with ConfigTools, the complete configuration of a MSX-E system can be saved and transferred to another system of the same type (clone function).

ConfigTools is included in the delivery.

### ConfigTools functions for MSX-E3021:

- Change of IP address
- Display of web interface
- Firmware update ٠
- Save/load system configuration ٠
- Save/load channel configuration
- Monitor for analog inputs

# Specifications\*

Number/type:	16 differential inputs	
Architecture:	4 groups of 4 channels each	
	4-port simultaneous converter with one 4-channe	
	multiplexer per converter	
Resolution:	16-bit, SAR ADC	
Accuracy:	± 1.221 mV typ. (± 4 LSB)	
	$\pm$ 2.442 mV max.	
Relative Accuracy (INL):	$\pm$ 3 LSB max (ADC)	
Optical isolation:	1000 V	
Input ranges:	± 5 V, ± 10 V (16-bit), 0-5 V, 0-10 V (15-bit)	
	current inputs optional	
Sampling frequency:	25 kHz per channel / 100 kHz max.	
Gain:	x1, x2, x10, x20, x100, x200, x1000, x2000	
	software-programmable	
Common mode rejection:	80 dB min. DC up to 60 Hz (diff. amplifier)	
Input impedance (PGA):	10 <sup>9</sup> Ω // 10nF against GND	
Bandwidth (-3dB):	160 kHz limited through TP filters	
	16 Hz version	
	with differential filter	
Trigger:	digital input, synchro,	
	software-programmable	
Offset error:	$\pm$ 1 LSB ( $\pm$ 305 $\mu$ V)	
Gain error:	$\pm$ 2.5 LSB	
Temperature drift :	2.3 x V <sub>in</sub> + 22.5 (μ V/ °C) typ.	
	$V_{in}$ : input voltage in Volts (-10 V $\leq$ $V_{in}$ $\leq$ +10 V)	
	In the temperature range	
	from -40°C to +85°C: 4.5 ppm/°C FSR	

RAM:	64 MB		
FLASH:	4 MB for system data		
Extended FLASH memory:	4 GB (3.7 GB for measured data)

**Ordering information** 

# MSX-E3021

Ethernet analog input system, 16 analog inputs, diff., 16-bit. Incl. technical description, software drivers and ConfigTools.

#### **Connection cables**

#### Voltage supply

CMX-2x:	Shielded cable, M12 5-pin female connector/open end, IP 65			
CMX-3x:	For cascading, shielded cable, M12 5-pin			
	female connector/male connector IP 65			
Trigger/Synchro				
CMX-4x:	Shielded cable, M12 5-pin female connector/open end, IP 65			
CMX-5x:	For cascading, shielded cable, M12 5-pin			
	female connector/male connector IP 65			
Ethernet				
CMX-6x:	CAT5E cable, M12 D-coded male connector/RJ45 connector			
CMX-7x:	For cascading, CAT5E cable, 2 x M12 D-coded male connector			

#### Connection to peripherals

CMX-8x: Shielded cable, M12 5-pin male connector/open end, IP 65
